

I/We Claim:

1. A method of administering a security system, said method comprising the steps of:  
receiving a surveillance profile from security equipment that has detected a security breach; and  
dispatching emergency services corresponding to the surveillance profile of the security equipment,  
wherein said step of receiving the surveillance profile from the security equipment includes receiving information identifying the detecting security equipment as at least one of a video camera, motion detector and heat detector, and further includes receiving at least one of registration information corresponding to the detecting security equipment, a location of the detecting security equipment and a physical description of the contents of a room in which the detecting security equipment is located.
2. The method of Claim 1, wherein said step of receiving a surveillance profile includes receiving the surveillance profile from a processor corresponding to the detecting security equipment.
3. The method of Claim 2, wherein the processor is located in a same building structure as the detecting security equipment, and wherein the processor stores the surveillance profile for all security equipment located within the same building structure.

4. The method of Claim 3, wherein said step of receiving a surveillance profile includes receiving the surveillance profile from the processor corresponding to the detecting security equipment over a broadband connection via a network interface device.

5. The method of Claim 3, wherein the broadband connection is either of a digital subscriber line (DSL) or a cable modem line.

6. The method of Claim 5, wherein, after said step of receiving a surveillance profile, said method comprises the further steps of:

requesting verification from a predetermined sequence of terminals corresponding to the detecting security equipment; and

receiving a predetermined authorization code; and

terminating further processing associated with the received surveillance profile.

7. The method of Claim 6, wherein said step of requesting verification from a predetermined sequence of terminals corresponding to the detecting security equipment includes at least one of calling a designated telephone number to request the predetermined authorization code from an answering party and transmitting the request for the predetermined authorization code to a designated internet protocol (IP) address for the processor corresponding to the detecting security equipment.

8. The method of Claim 7, wherein if the predetermined authorization code is not received, said terminating step is not performed, and said method further comprises, after said

dispatching step, the step of informing a subscriber of the security breach by calling a sequence of designated telephone numbers until the first of receiving a response by an answering party or exhausting the sequence of designated telephone numbers without receiving an answer.

9. The method of Claim 7, wherein said step of receiving a predetermined authorization code includes receiving a personal identification number (PIN) verbally using a voice recognition methodology.

10. The method of Claim 8, wherein said step of receiving a predetermined authorization code includes receiving a personal identification number (PIN) verbally using at least one of a voice recognition methodology and receiving the PIN electronically using an IP methodology.

11. The method of Claim 1, wherein said step of dispatching emergency services corresponding to the surveillance profile of the detecting security equipment includes dispatching at least one of a local fire department and a local police department in accordance with information identifying the security equipment as at least one of a video camera, motion detector and heat detector.

12. A method of administrating a security system, said method comprising the steps of:

receiving tracking information of emergency services personnel;

receiving a surveillance profile from security equipment that has detected a security breach; and

dispatching the emergency services personnel in accordance with the surveillance profile of the detecting security equipment and the received tracking information of emergency services personnel.

13. The method of Claim 12, wherein said step of receiving tracking information of the emergency services personnel includes receiving login registration information from individual emergency services personnel including those from police departments, fire departments and emergency medical technicians.

14. The method of Claim 13, wherein said step of receiving tracking information of the emergency services personnel further includes receiving global positioning services (GPS) information for individual emergency services personnel including those from police departments, fire departments and medical technicians.

15. The method of Claim 14, wherein said step of receiving the surveillance profile from the detecting security equipment includes receiving information identifying the detecting security equipment as at least one of a video camera, motion detector and heat detector.

16. The method of Claim 15, wherein said step of receiving the surveillance profile includes receiving at least one of registration information corresponding to the detecting

security equipment, a location of the detecting security equipment and a physical description of the contents of a room in which the detecting security equipment is located.

17. The method of Claim 16, wherein said step of receiving a surveillance profile includes receiving the surveillance profile from a database corresponding to the detecting security equipment.

18. The method of Claim 16, wherein the database includes a computer located in a same building structure as the detecting security equipment, and wherein the computer stores the surveillance profile for all security equipment located within the same building structure.

19. The method of Claim 18, wherein said step of receiving a surveillance profile includes receiving the surveillance profile from the computer corresponding to the detecting security equipment over a broadband connection via a network interface device.

20. The method of Claim 18, wherein the broadband connection is either of a digital subscriber line (DSL) or a cable modem line.

21. The method of Claim 12, wherein, after said step of receiving a surveillance profile from the detecting security equipment, said method comprises the further steps of:  
requesting verification from a predetermined sequence of terminals corresponding to the detecting security equipment; and  
receiving a predetermined authorization code; and

terminating further processing associated with the received surveillance profile.

22. The method of Claim 21, wherein said step of requesting verification from a predetermined sequence of terminals corresponding to the detecting security equipment includes at least one of dispatching a designated telephone number to request the predetermined authorization code from an answering party and transmitting the request for the predetermined authorization code to a designated internet protocol (IP) address for the computer corresponding to the detecting security equipment.

23. The method of Claim 22, wherein if the predetermined authorization code is not received, said terminating step is not performed, and said method further comprises, after said dispatching step, the step of informing a subscriber of the security breach by dispatching a sequence of designated telephone numbers until the first of receiving a response by an answering party or exhausting the sequence of designated telephone numbers without receiving an answer.

24. The method of Claim 22, wherein said step of receiving a predetermined authorization code includes receiving a personal identification number (PIN) verbally using a voice recognition methodology.

25. The method of Claim 23, wherein said step of receiving a predetermined authorization code includes receiving a personal identification number (PIN) verbally using at least one of a voice recognition methodology and an IP methodology.

26. The method of Claim 16, wherein said step of dispatching emergency services corresponding to the surveillance profile of the detecting security equipment includes dispatching at least one of a local fire department and a local police department in accordance with information identifying the security sensor as one of a video camera, motion detector and heat detector and the received tracking information of emergency services personnel.
